

Bayer

Impressive performance of new turf fungicide

In the present financial climate, many golf courses are keeping a tight rein on spending and greenkeepers are ever more conscious of the need for a cost effective fungicide programme that won't compromise efficacy.

Bayer's latest innovation in turf disease control, Interface®, comes with some ringing endorsements from 79%* of turf managers throughout Ireland and the UK, who put Interface® to the test under their own course conditions.

Feedback from these greenkeepers and groundsmen demonstrates impressive disease control, with the product performing above and beyond expectations.

Case in point: Joe Bedford, Course Superintendent at Hollystown Golf Club, just outside Dublin, who trialled Interface® in 2013:

"Like everyone at the moment, we are looking for the best value for money, 'every pound is a prisoner as they say'. It is very important that every product we use is successful," says Joe.

"We had an outbreak of Rust and Fusarium in June last year, just three weeks before Captain's Day. We needed something that would treat the problem instantaneously."

The course was treated with Interface® and near complete control of the disease was witnessed within 48 hours. The greens had completely recovered within seven days of using the product and impressively, the control lasted for seven weeks after treatment.

"You could visibly see the improvement of greens and it was incredible how much stronger the grass sward was following the use of Interface®.

"We live in a cool marine climate and are dealing with a lot of play throughout the year, so disease control is a top priority for us. I can see Interface® becoming a mainstay product in the fight against disease in turf," confirms Joe.

Bayer

“We were delighted to have been involved in a trial for this product; Interface® is going to be very much a part of our future.”
