

“Rodilon® Soft Block saves me time and money”

Experienced pest controller, Dave Hazzard, from Northamptonshire based Terminator Pest Control, has found great success using Rodilon® Soft Blocks, especially in areas with an abundant food source, such as farm grain stores.

“Keeping on top of rodent control on farm enterprises that can hold over 20,000 tonnes of grain, kept in 20 separate stores can be a massive challenge. On sites where there’s such a vast availability of food and plenty of shelter, lethal doses of rodenticide baits simply don’t get consumed.

“However, this hasn’t been the case with Rodilon® Soft Block. I like to put products to the test, to find out what works best in the situation. In one experiment, I put several different brands of bait out, close to a known rat nesting site one evening, and by 9am the next morning, all the Rodilon® had gone, while others hadn’t.

“I was so impressed with the results that I rolled out the use of this rodenticide across the whole farm, and the rate of uptake was replicated.

“In general, we rotate rodenticides roughly every 21 days to ring the changes and ensure uptake is maintained. The trouble was that when I switched away from the Rodilon® Soft Block, the uptake levels simply didn’t live up to the same standard.

“It really is the best product I’ve ever used. It saves me time on call-backs to sites, as I can normally gain control of rat infestation in less than a week, giving me time to work on other jobs, while saving on fuel and extra product costs.

“As well as situations where plenty of alternative food is available, I find one of the best times to use Rodilon® Soft Block is in very wet weather. Ditches tend to fill with water, forcing rodents to head indoors for shelter. Forecast rain is a handy indication to assess infestation levels in barns and other covered areas and apply Rodilon Soft Block at the earliest opportunity.”
