

Roundup amenity products Tank Mix Compatibility

Roundup products do not require additional adjuvants for most label uses at all rates. They are rainfast in 1-4 hours. The addition of a residual partner can be useful to extend the season in some situations. Topfilm® may improve weed control in aquatic situations and adjuvants like Mixture B NF are recommended for the control of Rhododendron and other very waxy leaved plants such as Laurel and Horsetail.

GENERAL ADVICE WHEN MIXING

- Check fields of use on the label before using a tank mix partner to ensure the partner is approved for the intended use.
- Check labels and make sure there is a suitable water volume for both products.
- Never pre-mix the products; always introduce the partners to the tank first, mix and then add the Roundup product.
- NB Roundup products are not compatible with moss killers.

Physically Compatible	
2,4,D*	MCPA*
Metazachlor (with agitation)	Mixture B NF
Flazasulfuron,(Chikara/Katana/Paradise)	Pistol
T80	Stomp 400 (with agitation)
Flexidor 125	TopFilm®
Kerb Flo	Spray marker dyes

* Mixtures with hormones e.g. 2,4,D or MCPA

Do not add more than 1l/ha of MCPA or 2,4 D to 3l/ha of Roundup ProActive or 2.25l of Roundup ProVantage. The hormone partner can cause antagonism when used at high rates.

2,4 D and MCPA mixtures with Roundup ProActive or Roundup ProVantage should not be used in low water volumes through knapsack sprayers or nozzle may become blocked.

Always use a minimum of 200l/ha and add the hormone partner to the half filled tank of water first, mix well and add water to three quarters of the final volume before adding the Roundup partner and finally topping up with water.

Other adjuvants and water conditioners designed for use with glyphosate formulations should be compatible by Monsanto has not tested all available products and is not liable for results.
